OUR PREMIUM TURF VARIETIES

There are so many reasons why Sir Walter is Australia's No. 1 Buffalo. Sir Walter Buffalo Lawn has stood the test of time, proving time and time again that it will go anywhere and grow anywhere; in full sun or shade, in extreme heat, frost or drought. Born right here in Australia, Sir Walter was bred to be tough yet soft, and good looking to boot! Since 1997 there has been over 50 million square metres of Sir Walter sold Australia wide - the equivalent of 450,000 homes. There is really no match for Sir Walter.

EUREKA Kikuyu Premium VG grown exclusively in Victoria, is a versatile turf variety that has been rigorously tested under local conditions. EUREKA Kikuyu Premium VG maintains better winter colour and has good winter growth activity and dense coverage for most of the year in Victoria.

One of the EUREKA Kikuyu Premium VG great benefits is that it needs less water and nutrients than other Kikuyu varieties, even in our increasingly drier climate allowing you to enjoy a green lawn without feeling guilty about water usage. EUREKA Kikuyu Premium VG might look pretty and have a soft touch, but this is a lawn with attitude! It's tough enough to handle all kinds of activities like backyard cricket, dogs, parties and barbeques. We've even tested it at a racetrack, so it'll easily handle your herd!

Nullarbor Couch is selected by Lawn Solutions Australia as the very best performing couch for your home lawn, sporting surface or commercial project. Nullarbor Couch is the couch variety that is best suited to your region, provides a good dense cover with a fine leaf blade and vibrant dark emerald green in colour. Enjoying a full sun position, the self repairing Nullarbor Couch has strong horizontal habit that makes it tolerant of low mowing and rapid repair from wear and other stresses. Nullarbor Couch is a great variety of turf for the cooler climates and has a low dormancy losing some colour over the winter months whilst having an early start of growth after winter.

Simply measure the area required for your new lawn. These 3 diagrams will help you to work out the area of lawn required.

Calculations

Circle

Multiply the radius by itself then by 3.14
eg. $4\text{m} \times 4\text{m} \times 3.14 = 51\text{m}^2$

Rectangle/ Square

Multiply the length by width
eg. $10\text{m} \times 3\text{m} = 30\text{m}^2$

Triangle

Divide 6m by 2 = 3m

Multiply $3\text{m} \times 10\text{m} = 30\text{m}^2$

NB - Always allow a little extra when ordering your lawn

When preparing to lay your lawn it is advisable to have at least 100mm of well-worked soil. This can be achieved by rotary hoeing the existing soil or if there is minimal or poor soil, additional top soil may be required. Remove all stones, clods and other debris.

Rake the entire area to ensure a smooth, even surface and allow about 25mm below paths and driveways for the thickness of the turf.

To enhance the establishment of your new lawn we recommend that you purchase our Sir Launcher.

Sir Launcher is a pre-blended fertiliser, water crystal product. We recommend using it on all of our

turf varieties so be sure to order it with your turf.

- 1.** Apply your Sir Launcher to the prepared soil area ensuring you apply an even coating of the pellets to the entire area.
- 2.** Begin laying your QWELTS along a straight edge, such as a driveway or path, furthest from the stack of turf. When laying the QWELTS place them on the ground, next to each other in a brick-work pattern. Do not push them up too hard as this can lift the turf leaving the root system without soil contact.
- 3.** The QWELTS can be trimmed with a sharp knife or hedge shears to conform with paths and garden edges.
- 4.** Top dressing your lawn with white washed sand at ½ cubic metre per 100m² of turf is recommended. Top dressing helps hold the turf down on the ground and retains moisture, protecting the turf from drying out, while filling small gaps. Sand can be worked through using the back of a rake, by hand or by watering it in.

It is essential that a thorough soaking with water of your lawn commence immediately upon installation. (approx 1000 litres per 100m²). It is vital that the lawn is kept moist until root growth is

established.

To successfully establish instant lawn in hot conditions, it is best to water up to three times per day, in the first week (approx 250lt/ 100m² per application depending on weather and soil moisture). Once the roots have taken hold, watering can be eased off. Tank and grey water are great alternative water solutions. Sub surface drip irrigation is the most efficient.

There are several key aspects to maintaining a beautiful healthy lawn:

- Ensure you fertilise your lawn regularly throughout the year. Apply fertiliser in September, December, March and again in April.
- Spray for weeds as required and keep an eye out for any grubs or diseases.
- Apply wetting agent at the start of summer to help with water infiltration and retention.
